

NAME

comitup.conf – Comitup configuration file format

DESCRIPTION

The *comitup.conf* file configures the wifi management service comitup(8). It is located in the */etc/* directory.

PARAMETERS*base_name*

By default, comitup will create a hotspot named **comitup-<nnnn>**, and publish avahi-daemon(8) host entries for **comitup-<nnnn>** and **comitup**. Setting this entry will change the **comitup** string with one of the users choosing.

web_service

This defines a user web service to be controlled by **comitup**. This service will be disabled in the **HOTSPOT** state in preference of the comitup web service, and will be enabled in the **CONNECTED** state. This should be the name of the systemd web service, such as *apache2.service* or *nginx.service*. This defaults to a null string, meaning no service is controlled.
